

Extra challenges: SELECT

Level 1

Exercise 1

Show products that are not Accessories, are in stock, and have a space in their name. Sort by category, then by price from highest to lowest.

Expected: 6 rows

Exercise 2

Show customers who live in a city starting with S or M, plus customers with no city at all.

Expected: 4 rows

Exercise 3

Which Shoes product is the second most expensive? Show only that one.

Expected: 1 row

Exercise 4

Of the customers who joined in 2024 or 2025, show the 3 who joined most recently. Solve it without BETWEEN and without >=.

Expected: 3 rows

Level 2

Use the SQLite documentation: sqlite.org/lang_corefunc.html

Exercise 5

Show each customer's full name in one column called full_name (like "Anna Lindqvist"), sorted by last name.

Look up: || · **Expected:** 10 rows

Exercise 6

Give every product a price level: budget under 200 kr, mid from 200 to 799 kr, premium from 800 kr.

Look up: CASE WHEN · **Expected:** 12 rows: 4 budget, 5 mid, 3 premium

Exercise 7

Show every customer's first name and city, but write Unknown instead of NULL.

Look up: COALESCE · **Expected:** 10 rows

Exercise 8

Which customers joined in the first half of a year (January to June), whatever the year?

Look up: strftime · **Expected:** 6 rows

Exercise 9

Which product has the longest name?

Look up: LENGTH · **Expected:** 1 row

Exercise 10

Show each customer's email username: the part before the @.

Look up: substr and instr · **Expected:** 10 rows

Level 3**Exercise 11**

Which products cost more than the average price? Don't type the average yourself: let SQL calculate it inside the query.

Expected: 5 rows

Exercise 12

Make a price list with one column that says, for example, "Socks 3-pack costs 129 kr". Only products in stock, cheapest first. Watch out: does it say 129 or 129.0? Fix it.

Expected: 10 rows

Exercise 13

How many customers live in each city? Biggest city first.

Look up: GROUP BY · **Expected:** 6 rows
